THOUGHT NOTE

The provided HTML code appears to be a webpage structure for displaying information about four different animated characters: Doraemon, Shinchan, Tom, and Jerry and the code is explained below: -

1. First, I created a navigation bar by using property nav-pills and created 3 navigation items named as – Home, Profiles, Logout.
2. a navigation bar using an unordered list (`<ul>`) with Bootstrap classes.
3.   - It includes three navigation items: "Home," "Profiles" (with a dropdown menu), and "Logout" (which is disabled).

4. I created a Homepage of these characters with the file name index.html in which I have included some cartoon characters in a card format using card property.

   - Each card contains an image, a title, a description, and a button to check the character's profile.

Overall, this HTML code creates a simple webpage with a navigation bar and character profile cards. It utilizes Bootstrap

for styling and interactivity, making it easier to create a visually appealing and user-friendly interface. Users can click on the "Profiles" dropdown to access information about different animated characters.

For Doraemon's profile and other profile the HTML code appears to be a webpage focused on. Below is the used code:

1)

   - This code section creates a navigation bar using an unordered list (`<ul>`) with Bootstrap classes same as in case of index.html

   - It includes three navigation items: "Home," "Profiles" (with a dropdown menu), and "Logout" (which is disabled).

   - The "Profiles" link is marked as active, indicating the current page.

This HTML code creates a simple webpage dedicated to Doraemon's profile. It follows Bootstrap's styling conventions for navigation bars, cards, and responsiveness. Users can

navigate to other profiles from the "Profiles" dropdown menu in the navigation bar.
